

## Ontario GeoPortal

### Ontario GeoPortal: Leveraging the Power of Geography

GeoPortal helps organizations harness the power of geography without the cost of acquiring the resources themselves. Ontario Realty Corporation's Geomatics Unit, through its GeoPortal platform, is able to provide a variety of GIS services to government organizations. We have the skills and experience acquired through many projects supporting internal and external clients with their mapping and special data needs.

GeoPortal has three components: **GeoViewer, DataViewer and DocumentViewer**

#### GeoViewer

- Quickly see and find your assets and places/features of interest
- Find a feature or asset by using the map or keywords
- Immediately access related reports, documents and database records
- Instant mapping functions combine multiple data sources into one window (e.g. your organization's data, MPAC, Google and Teranet)
- Your data can be simultaneously mapped or overlaid to visually demonstrate geographical and geopolitical relationships: for example property ownership, ridings, land claims, designated green space and endangered species

#### DataViewer

- Tie data and mapping information in an easy-to-understand format essential to report generation and presentations
- Output to Excel for further analysis
- Link to related documents, reports and information

#### DocumentViewer

- Manage content with direct links from GeoViewer and DataViewer
- Integrate with your OpenText, SharePoint, network file systems
- Enable file management in your business systems
